

CLAIMS

1. In a communication system, a method of communicating data comprising:

accepting data from a source of user data;

accumulating the data until a Huffman codeword is recognized;

mapping the Huffman codeword into a channel symbol;

and

applying the channel symbol to an input of a channel.

2. The method of claim 1 further comprising scrambling the user data into pseudo-random data.

3. The method of claim 1 further comprising performing additional channel coding operations to achieve coding gain in addition to shaping gain.

4. The method of claim 1 further comprising performing a framing operation on the data.

5. The method of claim 1 further comprising modulating channel symbols in various ways.

6. The method of claim 1 further comprising receiving symbols from an output of the channel.

7. The method of claim 2 further comprising:
receiving symbols from an output of the channel; and

descrambling the received pseudo-random data into user data.

8. The method of claim 3 further comprising receiving symbols from an output of the channel by performing additional channel decoding operations.

9. The method of claim 4 further comprising:
receiving symbols from an output of the channel; and
performing a deframing operation.

10. The method of claim 5 further comprising receiving symbols from an output of the channel by performing demodulation operations.

11. The method of claim 6 further comprising performing a Huffman encoding operation on received channel symbols.

12. The method of claim 11 further comprising
communicating the received data to a sink of user data.

13. The method of claim 1 wherein a symbol constellation with unequal symbol probabilities leads to a shaping gain of greater than 1 dB.

14. The method of claim 13 whereby a shaping gain of approximately 1.35 dB is attained.

15. The method of claim 13 whereby a shaping gain of approximately 1.5 dB is attained.

16. A communication system comprising:
a communication node having a shaper, the shaper generating channel symbols in a constellation that exhibits a shaping gain of greater than 1 dB.
17. The system of claim 16 whereby a shaping gain of approximately 1.35 dB is attained.
18. The system of claim 16 whereby a shaping gain of approximately 1.5 dB is attained.
19. The system of claim 16 wherein the communication node further comprises a transmitter, and wherein the transmitter comprises the shaper.
20. A communication system comprising a communication node that performs a Huffman decoding operation to generate channel symbols.
21. The system of claim 20 wherein the Huffman decoding operation results in a constellation of symbols and associated symbol probabilities leading to a shaping gain greater than 1 dB.
22. The system of claim 21 whereby a shaping gain of approximately 1.35 dB is attained.
23. The system of claim 21 whereby a shaping gain of approximately 1.5 dB is attained.

24. The system of claim 20 wherein the communication node has a transmitter, and wherein the Huffman decoding operation is performed by the transmitter.
